EYEVI

EYEVI is a web-based application that provides panoramic images of streets with metric scale and geographic coordinates.

What is it for?

- perform high accuracy 3D measurements (distance, length, area, height) and export the results in various data formats
- collect data with x, y, z coordinates and add attribute information in the image view
- visualize 2D or 3D datasets in a pointcloud view and analyze them with other functionalities in the image and orthophoto views

Target group:

- state and local government
- utility network management companies
- road construction and maintenance companies
- engineering, land surveying, and architecture firms

All 3 types of views will be created using a car mounted mobile mapping system.
